

Telescope Viewing

Welcomes you to free

How to get the most out of your viewing experience

- Don't just peek and run. Take a minute or two at the eyepiece. Adjust your position so you're comfortable. There's plenty of time.
- Start with your eye about half an inch from the eyepiece.
- Focus! Pick a tiny point-like object and watch it while you twist the focus knob slightly (usually less than a full turn) adjusting for the sharpest possible image.
- If you wear eyeglasses, try viewing with and without them.
- There will be fleeting moments when the object becomes clearer while you're viewing. This is caused by Earth's atmosphere in motion. Wait for some of these moments, and notice how the object looks during these flashes of best "seeing."
- Avert your eyes from the main object. Look around. Notice whether the object appears clearer when you're not looking directly at it.

What to look for when viewing Saturn
